Release of Fl-Ova from Fl-Ova/PVA implants. Implants were prepared, placed in PBS solutions for up to 70 hours and the amounts of Fl-Ova released at given time points were determined. **Panel A.** The Fl-Ova amounts released over time were plotted and the in-vitro kinetics/release rate is shown. The insert shows a blow-up of release between 20-70 hours. **Panel B.** Cumulative amount of Fl-Ova released by the PVA implant over time was calculated and is shown.
