Supplemental Figure 3. Intracellular localization of ODAG-EGFP fusion protein.
(A) Experimental procedure. An expression vector containing ODAG-EGFP fusion cDNA downstream of cytomegalovirus (CMV) promoter was transfected into Cos7 cells. (B) Bright-field and fluorescent images of transfected Cos7 cells. In vector-transfected cells (indicated by arrows in the left panel), ODAG-EGFP fusion protein is found mainly in the nucleus and partly in the cytoplasm (right panel). The bar indicates 20 μm.
