Figure S10. Assessment of pupil response to mydriatic at week 15. In the same OHT cohort as used in the main study (n = 15) at 30 minutes after using one drop 0.5% tropicamide, the pupil size in ControlO (A) and OHT eyes (B) were assessed by photography under ketamine/xylazine anesthesia. A scale bar was included in all images. The distance between each graduation line is 1 mm. Image analysis was used to measure pupil diameter. (C) There was no difference in pupil dilation between the two eyes (two-tail paired T test, p = 0.162). The absence of pupil synechia suggests that there was no severe inflammation in the OHT eyes, consistent with the lack of strong Iba-1 expression in the retina (Figure 6).
