**SUPPLEMENTAL FIGURE 1.** Repeated measurements of the subretinal choroidal thickness (SCT) before and after hemodialysis every other day when the consecutive sessions of hemodialysis were performed. The SCT increases again before hemodialysis and decreases again after hemodialysis in both groups (*$P < 0.01$, before vs. after hemodialysis in the end-stage kidney disease (ESKD) due to diabetic nephropathy [DM] group, and †$P < 0.05$, before vs. after hemodialysis in the non-diabetic ESKD [NDM] group, Wilcoxon t-test).
