Supplemental Figure 1. Chronologic changes in the distance from the thinnest location to the corneal center ($D_{mn}$).

Blue, green, red, and black dashed lines represent eyes with keratoconus, KCS, FFK, and normal controls respectively. + marks indicate the last examination before the development of acute hydrops.
Supplemental Figure 2. Chronologic changes in maximal K value ($K_{\text{max}}$).

Blue, green, red, and black dashed lines represent eyes with keratoconus, KCS, FFK, and normal controls, respectively. + marks indicate the last examination before the development of acute hydrops.
Supplemental Figure 3. Bland–Altman plot of differences against mean $R_{post}$ observations ($n = 107$).
