Supplemental Figure 1

Figures A – E. Cross-sectional scatter plot showing the dark adapted (DA) 0.01 amplitudes, DA 10.0 b-wave amplitudes, light adapted (LA) 3.0 30 Hz peak times, LA 3.0 a-wave amplitudes and LA 3.0 b-wave amplitudes, respectively, in relation to age, for patients with different genotypes. The individual splicing mutations of patients from group B are marked with different symbols. The full line represents the regression line of group A and dashed lines its 95% confidence interval (CI). The grey area represents the 95% confidence interval of healthy controls.
