Supplementary Figure 3: Cumulative distribution plots of IRC (A), SRF (B) and PED (C) in Cirrus (left column) and Spectralis (right column) scans broken down according to quartiles of lesion extension. Frequency of lesion coverage per-pixel overall patients is greyscale-coded. Outward spreading with growing extent can be observed for all pathomorphologic components, most pronoucendly in SRF. Graphs are centered on the fovea and right eyes are mirrored to conform to left eyes.
