Additional material 6: B-scans, en face SD-OCT, EZ reflectivity measurement (color scale) and visual acuity of patients from the three groups. A: Patient from the control group, with normal OCT scans and high levels of EZ reflectivity. B: Patient from the No-DME group with normal appearing OCT scans but subtle decrease of EZ reflectivity. C, D and E: Patients from the R-DME group with EZ impairment visible on OCT scans and significant reduction of EZ reflectivity. BCVA (Snellen equivalent) in the different groups were correlated with the level of reflectivity.
