Age-adjusted Krachmer grade residuals: Parent

Age-adjusted Krachmer grade residuals: Offspring
Supplementary Figure 1. Scatterplot of Krachmer grade residuals by age-adjustment

Age-adjustment of the Krachmer grade (KG) was performed according to the linear regression model: $KG \sim Age + Age^2 + residual$. After adjustment, the KG residuals are not statistically different between the parental and child generations ($P = 1.2 \times 10^{-1}$).
