Suppl. Figure 2
Suppl. Figure 3
Suppl. Figure 4
SUPPLEMENTAL FIGURE LEGENDS

Suppl. Figure 1. Geographic distribution of the 47 USH2 patients analyzed in the study. Bubble size is proportional to the number of patients in the location.

Suppl. Figure 2. Typical fERG recordings from a normal control subject and two USH2 patients. Peak-to-peak first harmonic amplitudes were 2.6 uV (ctrl), 0.9uV (pz 21), and 0.5 uV (pz 37).

Suppl. Figure 3. fERG test-retest variability in the 12 USH2 patients in the cohort with inter-visit interval within 4 months. Labels identify patients according to their listing in Table I.

Suppl. Figure 4. fERG distribution versus age for the 23 USH2 patients with identified genetic variants (dark squares). Gray symbols refer to the entire cohort.
