Fig. S1 Identification of the origin of senescent cells from corneal stromas. Corneas were analyzed after 3 days of epithelial debridement. (A) Representative images of immunofluorescence for CD45 or CD11b following corneal sectioning. The dashed frames are shown in an enlarged view. (B) Representative flow cytometry histograms from analysis of CD45 and SPiDER-β-gal expression in isolated stromal cells of control (Con) and epithelium debrided corneas (De. epi). Scale bars, 50 μm.
