Supplemental Figure 2. Scatter plot showing linear relation between severity of HCQ retinopathy and ONL thickness in the analyzed regions.

The figure demonstrates a progressive ONL thinning throughout the disease stages (standardized β coefficient=-0.184 and p=0.148 in the foveal region, standardized β coefficient=-0.239 and p=0.059 in the parafoveal region, and standardized β coefficient=-0.385 and p=0.002 in the perifoveal region).
