Supplementary Figure S3. Demonstration of an eye in which eye-specific geographic atrophy (GA) border expansion rate (BER) differed between team A (A and B) and team B (C and D). A and C, GA delineations at year 4 after enrollment were comparable between team A and B. However, team A and B differed greatly at year 5 after enrollment, which was likely because GA margins were unclear in the color fundus photograph. Due to the measurement errors, eye-specific GA BER was 0.04 mm/year based on team A’s gradings but was 0.19 mm/year based on team B’s gradings.
