Supplementary Material B. Contrast thresholds (denoted with 'x') for the object/non-object discrimination task for all 12 observers are shown in the isoluminant plane (S vs. L-M). Thresholds are defined in terms of radius in the isoluminant plane (see Methods for the corresponding cone contrasts; cf. Figure 1). For the full-colour thresholds (S; L-M; L+M+S) only the chromatic threshold component (S; L-M) is shown in this graph. The scaled stimulus contrasts are indicated with a filled circle; these contrasts were used for the main behavioural and EEG experiment.
