Supplementary table S4 shows mean RMS values and their corresponding mean ranges obtained from four different handles. No statistically significant differences were found in RMS and range values among different handle designs at mixed and at low frequencies. However at high frequencies, handle 4 showed statistically significant lower RMS values compared to other handles and statistically significant lower ranges when compared to handle 1 and 2. Also at higher frequencies handle 3 showed statistically significant lower RMS values when compared to handle 1 and 2.
