Supplemental figure 1. Coprevalence of NAbs against AAV2, AAV5, AAV8, and AAV9 in the serum for dilutions of $\geq 1:100$ and $\geq 1:400$. Thirty-two samples demonstrated AAV neutralization for at least one of the four serotypes. With the exception of one sample, all serum samples at $\geq 1:100$ and $\geq 1:400$ neutralized AAV2. AAV = adeno-associated virus; NAbs = neutralizing antibodies.
