

Supplemental Figure S4. Thickness of different retinal geographic regions of ADVN-022 treated animals show no significant difference between baseline and late time points measurements (out to 21 or 30 months). The retinal regions are indicated on a typical retinal thickness map (top left) and include (from top left to bottom right): (1) central, (2) inner superior, (3) inner temporal, (4) inner inferior, (5) inner nasal, (6) outer superior, (7) outer temporal, (8) outer inferior, (9) inner nasal retina. Measurements are represented for each eye in the study for every time point assessed and each symbol represents one individual eye.
