

Supplementary Figure S1. Subjects with usable AOSLO images have significantly better BCVA than subjects with unusable AOSLO images. This trend was present in both (A) subjects with achromatopsia ($p = 0.0072$, Mann-Whitney test) and (B) subjects with albinism ($p = 0.0040$, unpaired t-test). The ends of the boxes are the 25th and 75th percentiles, the dashed line is the median, and the whiskers span the range of data.
